

CISS350: Data Structures and Advanced Algorithms
Quiz q10206

Name: YOUR EMAILScore:

Note that **answercode** is for writing code/pseudocode/simple answers and does not require mathematical notation. For **answerlong**, you can enter \LaTeX code for mathematical notation. Some incomplete/wrong answers are included in the **answerlong** – you will need make modifications.

Here are some pointers on writing math \LaTeX code:

1. For “inline math mode”, use $\$ \dots \$$. Example: $\$x = 42 + y\$$ gives you $x = 42 + y$. (Mathematical expressions have their own spacing, special symbols, and are in italics.)
2. For “display math mode”, use $\backslash[\dots \backslash]$. Example: $\backslash[x = 42 \backslash]$ gives you

$$x = 42$$

(Display math mode is used for emphasis.)

3. Here’s how you do fractions: $\$ \backslash \text{frac}\{1\}\{2\} \$$ gives you $\frac{1}{2}$.
4. Here’s how you do subscript: $\$ \text{t}_{\{123\}} \$$ gives you t_{123} .
5. Here’s how you do superscript: $\$ \text{n}^{\{123\}} \$$ gives you n^{123} .
6. Here’s how you do log: $\$ \backslash \text{lg } n \$$ gives you $\lg n$.
7. Example: $\$ T(n) = \backslash \text{frac}\{1\}\{2\} \text{t}_{\{42\}} \text{n}^3 \backslash \text{lg } n = A \text{n}^3 \backslash \text{lg } n = O(\text{n}^3 \backslash \text{lg } n) \$$ gives you $T(n) = \frac{1}{2}t_{42}n^3 \lg n = An^3 \lg n = O(n^3 \lg n)$.

The above information should be enough for this quiz. For more information on \LaTeX you can go to [my website](#), scroll down to the Tutorials section and click on latex.pdf.

PLOTING GRAPHS

This quiz involves computing the N and C in the big-O definition using graphical method. Recall that the graphical method, strictly speaking, does not provide a proof. It's only a plausible verification.

Here are some examples on plotting graphs. Make sure you look at the \LaTeX code (look for TO BE COMPLETED).

Plotting some hand-coded points:

Plotting points using formulas:

(TURN PAGE)

Q1. Find N and C such that $|f(n)| \leq C|n^2|$ for $n \geq N$ for n up to 100. Choose C to be an integer and as small as possible and then choose N to be one of the values in $\{0, 10, 20, 30, \dots, 100\}$ and as small as possible. Modify the graph accordingly.

(Note: In the formal definition of big- O , the choice of N and C can be any real numbers. I'm restricting your choice of N and C for question to make the answer simple. Also, note that this does not really imply $f(n) = O(n^2)$ since this question only verifies of $|f(n)| \leq C|g(n)|$ where $g(n) = n^2$ for n only up to 100.)

ANSWER:

$N = ?, C = ?$

(TURN PAGE)

Q2. Find positive integer k such that there exist N and C such that $|f(n)| \leq C|n^k|$ for $n \geq N$ for n up to 1000. First you want k be as small as possible. Then choose C to be an integer and as small as possible and then choose N to be one of the values in $\{0, 100, 200, 300, \dots, 1000\}$ and as small as possible. Modify the graph accordingly.

(Note: In the formal definition of big- O , the choice of N and C can be any real numbers. I'm restricting your choice of N and C for question to make the answer simple. Also, note that this does not really imply $f(n) = O(n^k)$ since this question only verifies of $|f(n)| \leq C|n^k|$ for n only up to 1000.)

ANSWER:

$k = ?, N = ?, C = ?$

INSTRUCTIONS

In the file `thispreamble.tex` look for

```
\renewcommand\AUTHOR{}
```

and enter your email address:

```
\renewcommand\AUTHOR{jdoe5@cougars.ccis.edu}
```

(This is not really necessary since alex will change that for you when you execute `make`.) In your bash shell, execute “`make`” to recompile `main.pdf`. Execute “`make v`” to view `main.pdf`.

Enter your answers in `main.tex`. In the bash shell, execute “`make`” to recompile `main.pdf`. Execute “`make v`” to view `main.pdf`.

For each question, you’ll see boxes for you to fill. For small boxes, if you see

```
1 + 1 = \answerbox{}
```

you do this:

```
1 + 1 = \answerbox{2}
```

`answerbox` will also appear in “true/false” and “multiple-choice” questions.

For longer answers that need typewriter font, if you see

```
Write a C++ statement that declares an integer variable name x.
\begin{answercode}
\end{answercode}
```

you do this:

```
Write a C++ statement that declares an integer variable name x.
\begin{answercode}
int x;
\end{answercode}
```

`answercode` will appear in questions asking for code, algorithm, and program output. In this case, indentation and spacing is significant. For program output, I do look at spaces and newlines.

For long answers (not in typewriter font) if you see

```
What is the color of the sky?
\begin{answerlong}
\end{answerlong}
```

you can write

```
What is the color of the sky?  
\begin{answerlong}  
The color of the sky is blue.  
\end{answerlong}
```

A question that begins with “T or F or M” requires you to identify whether it is true or false, or meaningless. “Meaningless” means something’s wrong with the question and it is not well-defined. Something like “ $1 + 2 = 4$ ” is either true or false (of course it’s false). Something like “ $1+2 = 4?$ ” does not make sense.

When writing results of computations, make sure it’s simplified. For instance write 2 instead of $1 + 1$.

HIGHER LEVEL CLASSES.

For students beyond 245: You can put L^AT_EX commands in `answerlong`.

More examples of meaningless statements: Questions such as “Is $42 = 1+2$ true or false?” or “Is $42 = \{2\}^{\{3\}}$ true or false?” does not make sense. “Is $P(42) = \{42\}$ true or false?” is meaningless because $P(X)$ is only defined if X is a set. For “Is $1 + 2 + 3$ true or false?”, “ $1 + 2 + 3$ ” is well-defined but as a “numerical expression”, not as a “proposition”, i.e., it cannot be true or false. Therefore “Is $1 + 2 + 3$ true or false?” is also not a well-defined question.

More examples of simplification: When you write down sets, if the answer is $\{1\}$, do not write $\{1, 1\}$. And when the values can be ordered, write the elements of the set in ascending order. When writing polynomials, begin with the highest degree term.

When writing a counterexample, always write the simplest.
